

## WHAT IS THE HEALING PROCESS AFTER IMPLANT SURGERY?

Usually the healing after surgery is uneventful.

Patient will have some pain and soreness for 2-3 days to a week depending on extent of surgery.

Some swelling is possible after extensive surgery.

We remove stitches in a week usually.

An Implant takes about 3-4 months to integrate with the bone. After an adequate healing period, implant stability is checked, and if the stability is good, process of making a crown starts.
