

WHAT IS A CT SCAN?

A CT scan is a 3D X-ray.

It allows us to see the teeth and bone in 3D as well as from different point of view.

It helps us to

- See the thickness and volume of bone for implant
- See the distance from vital structures like nerve and sinus
- Plan the placement of implants
- Design a surgical guide
- See some infections and defects which is not visible on 2D X-ray
