

WHAT IS A TEMPORARY IMPLANT CROWN?

Once we loose a tooth, the gums in that area becomes flat.

If we fabricate a crown on front teeth with improperly shaped gums, it will not provide an esthetically pleasing result.

We must achieve proper shape of gums that is curved gums on tooth and gum peaks between the teeth in order to make the teeth look beautiful.

We make a temporary crown to shape the gums in desired way. Once the gums heal and takes the desired shape we fabricate a final crown.

Flat gums

Properly shaped gums
