

## WHAT ARE VENEERS ?

Veneers are thin restorations made from porcelain that covers front surface of teeth. ( A good analogy would be they are like fake nails)

Veneers can be done to improve patient's smile in the following conditions:

- ◆ When a patient wants to improve color of the teeth
- ◆ When there is spaces between the teeth
- ◆ When patient is not happy with the shape of teeth
- ◆ When a patient's teeth are fractured or worn and need repair.

The teeth are shaved a little bit and scanned.

Veneers are fabricated in lab and then bonded to the teeth.

Once bonded in place they are very strong and if patient takes good care, they last very long.
